## Summary

naif-pds4-bundler (NPB) is a Python package that enables SPICE kernels archive producers to get familiar with, design, and generate Planetary Data System (PDS) ([Prockter et al., 2021](#)) SPICE archives from end-to-end using the applicable PDS4 standards ([NASA Planetary Data System, 2021](#)).

A SPICE archive includes the complete set of SPICE data files (kernel files) for a given mission, which can be accessed using SPICE software. The SPICE data contain geometric and other ancillary information needed to recover the full value of science instrument data. In particular SPICE kernels provide spacecraft and planetary ephemerides, spacecraft and instrument orientation, instrument mounting alignments, data specifying target body size, shape and orientation, and data needed for relevant time conversions. Data in SPICE kernel files must be accessed using the software called the SPICE Toolkit produced and distributed by the Navigation and Ancillary Information Facility (NAIF) Node of the Planetary Data System ([Acton, 1996](#); [Acton et al., 2018](#)).

NPB is an open source software project led by the NAIF group at the Jet Propulsion Laboratory (JPL) with the support of the PDS Engineering Node (PDS-EN). NPB makes use of the SPICE Toolkit through the open source Python wrapper SpiceyPy ([Annex et al., 2020](#)). NPB is hosted at the [NASA PDS GitHub repository](#) and is easy to install since it is hosted in the Python Package Index and includes a number of ready-to-go examples that facilitate the task to set it up.

NPB also includes [documentation](#) that describes the process to prepare SPICE archives and describes the NAIF approach to using PDS4 standards in great detail. Adhering to this approach is critical to the current and future use of archived SPICE data, especially to achieve interoperability across national archives, and, to facilitate use of archived SPICE data in data search, retrieval and processing tools that are, or will be, part of archive systems.

The planetary data community and SPICE archive producers are encouraged to contribute to the project following the [NASA PDS Code of Conduct](#). The expected forum to have discussions related to NPB is the [OpenPlanetary community](#).

## Statement of need

SPICE is widely used in the planetary data community and is the recommended ancillary data standard by the [International Planetary Data Alliance](#) (IPDA). Most planetary science space missions that use SPICE data normally intend to generate a PDS4 SPICE kernels archive; NPB is aimed to make things easier for those generating such archives.

NPB is used in the day-to-day archiving activities of NAIF and is used to generate all the PDS4 archives: Mars 2020 ([Costa-Sitja, Semenov, et al., 2021](#)), MAVEN ([Semenov & Costa-Sitja,](#)

20 2021b), InSight (Semenov & Costa-Sitja, 2021a), OSIRIS-REx (Semenov & Costa-Sitja, 2021c),  
21 and LADEE (Costa-Sitja & Semenov, 2021).

22 Both the European Space Agency (ESA) SPICE Service (ESS) and the Japanese Space  
23 Exploration Agency (JAXA) Data Archives and Transmission System (DARTS) have started  
24 using it for their PDS4 SPICE Archives: ExoMars2016 (Costa-Sitja, Escalante, et al., 2021),  
25 BepiColombo (Escalante et al., 2021), Venus Climate Orbiter Akatsuki, and Hayabusa2.

26 In the future, in addition to supporting NASA's, ESA's and JAXA's SPICE PDS4 archives, NPB  
27 could also help the rising community of science small satellites and commercial science payloads  
28 that could greatly benefit from such a package to reduce the effort spent on generating SPICE  
29 PDS4 archives.

## 50 State of the field

51 Understanding and generating the PDS4 artifacts required by PDS4 archives is a challenging  
52 endeavor. Because of this PDS is making an effort to generate and gather training material  
53 and to provide a number of tools to assist archive producers. NPB is part of this effort and  
54 benefits from NAIF's terse usage of the PDS4 standards and enables archive producers to  
55 generate a PDS4 SPICE archive from end-to-end with a minimal effort.

56 Different nodes of the PDS offer a number of tools adequate for the data archived in their  
57 holdings. PDS-EN provides the Metadata Injector for PDS Labels (NASA Planetary Data  
58 System, 2010); a command-line interface for generating PDS4 Labels using a user provided  
59 PDS4 XML template and input (source) data products. The PDS Geosciences Node provides  
60 MakeLabels a program that generates PDS4 labels using a label template and one or two Excel  
61 spreadsheets. The PDS Small Bodies Node (SBN) also provides a suite of tools to assist the  
62 label generation. In addition, SBN provides an end-to-end web-based tool to generate PDS4  
63 archives, but it only supports Images (FITS and 2-D arrays) and tables.

## 64 Acknowledgements

65 The author would like to thank the NAIF group at JPL, especially Boris Semenov, the PDS-EN  
66 at JPL and the colleagues of the ESA SPICE Service and the Planetary Science Archive at the  
67 European Space and Astronomy Center. This project was carried out at the Jet Propulsion  
68 Laboratory, California Institute of Technology, under a contract with the National Aeronautics  
69 and Space Administration (80NM0018D0004).
